

# 3-minute video script

---

## 0:00-0:25 — The problem as I see it

"₹2,000 and 7 days for 500 final-year students. That budget can't buy 500 people with ads. So my plan is to make students bring each other, and I built the engine that does that."

## 0:25-1:05 — The student + plan (show growth plan)

Final-years in placement season with no AI project on their resume. Three channels: 25 campus ambassadors (~220), the referral loop (~160), clubs and placement cells (~60), plus a long tail. All ₹2,000 goes to top-3 referrer prizes.

## 1:05-2:15 — Live demo

- 1 Open an ambassador's link: "Medaram Vishnu Vardhan from Amrita invited you".
- 2 Register (show the duplicate check too: same number with +91 goes back to the same page) → personal link, WhatsApp share, Add to Google Calendar (because registered isn't attended), reward ladder.
- 3 "Write my message" → pick club group / Telugu.
- 4 Register a friend through the link → count goes to 1, first tier unlocks.
- 5 Leaderboard: college vs college.
- 6 Dashboard: pacing vs plan, channel conversion, K-factor, peak hour, and the auto-insights. Say clearly that this is simulated data from my plan's assumptions.

## 2:15-2:45 — How I thought

What I changed from my first idea, one thing AI suggested that I rejected and why.

## 2:45-3:00 — Next 24 hours

Connect the n8n webhook (already built) for welcome emails and reminders, a waitlist after 500, referral fraud checks, attendance tracking.
